

Project Design Phase

Problem - Solution Fit

Date	18 July 2026
Team ID	SWTID-2026-2426
Project Name	Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits
Maximum Marks	2 Marks

The Problem-Solution Fit Canvas helps the team validate that the proposed data analytics solution genuinely addresses the real problems, constraints, and behaviour of the people it is designed for, before committing to build it.

1. CUSTOMER SEGMENT(S) Business Analysts and Operations Managers within food delivery businesses, and end customers who order food through the platform.	2. JOBS-TO-BE-DONE / PROBLEMS Analysts need to understand order trends and customer preferences. Managers need to identify delivery delays and inefficiencies. Customers want fast, affordable delivery with good cuisine variety.	3. TRIGGERS Increasing competition in the food delivery industry; large volumes of raw order data with no clear way to extract insights; recurring delivery delays and inconsistent service.	4. EMOTIONS: BEFORE / AFTER Before: overwhelmed by unstructured data (analyst/manager); frustrated by slow, inconsistent delivery (customer). After: confident, data-driven decision-making (analyst/manager); satisfied and likely to reorder (customer).
5. AVAILABLE SOLUTIONS Manual spreadsheet analysis, generic sales reports, and basic dashboards without deep drill-down; decisions often rely on intuition and past experience rather than structured data.	6. CUSTOMER CONSTRAINTS Large, complex datasets across many attributes (Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, Time Taken); limited time to manually process data; no standardized analytical tool.	7. BEHAVIOUR Analysts and managers manually review raw order and delivery reports. Customers choose cuisine and meal type based on convenience and reorder mainly during peak lunch and dinner hours.	8. CHANNELS of BEHAVIOUR 8.1 Online: food delivery app/website, Tableau dashboards accessed via browser. 8.2 Offline: internal business reports, spreadsheet reviews, in-person operations meetings.
9. PROBLEM ROOT CAUSE Food delivery businesses collect large volumes of order data but lack a structured analytical approach to convert it into actionable insights, making it difficult to understand demand drivers, customer preferences, and delivery performance.	10. YOUR SOLUTION A Tableau-based analytics solution that visualizes food ordering data (Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, Time Taken for Delivery) through interactive dashboards - revealing top-performing cities, high-demand cuisines, peak mealtimes, and delivery time trends to support data-driven decisions for analysts and operations managers, and to improve the overall customer experience.
